

Unit 3: CSS Text and Fonts

Introduction

CSS Text and Font properties are used to control the appearance of text on a webpage. These properties help improve readability, design, and the overall user experience.

1. Text Color

Definition

The `color` property is used to change the color of text.

Syntax

```
selector{  
  color: value;  
}
```

Example

```
<p class="text">Welcome to CSS</p>
```

```
.text{  
  color: blue;  
}
```

Output

Welcome to CSS (Displayed in blue)

2. Text Alignment

Definition

The `text-align` property specifies the horizontal alignment of text.

Values

- left

- center
- right
- justify

Example

```
<h2 class="heading">Full Stack Development</h2>
```

```
.heading{  
  text-align: center;  
}
```

Output

The heading is displayed at the **center** of the webpage.

3. Text Decoration

Definition

The `text-decoration` property is used to add or remove decorations from text.

Values

- none
- underline
- overline
- line-through

Example

```
<p class="underline">Welcome to CSS</p>
```

```
.underline{  
  text-decoration: underline;  
}
```

Output

Welcome to CSS

4. Text Transform

Definition

The `text-transform` property changes the capitalization of text.

Values

- uppercase
- lowercase
- capitalize

Example

```
<p class="transform">welcome to css</p>
```

```
.transform{  
  text-transform: uppercase;  
}
```

Output

WELCOME TO CSS

5. Text Shadow

Definition

The `text-shadow` property adds a shadow effect to text.

Syntax

```
text-shadow: horizontal vertical blur color;
```

Example

```
<h1 class="shadow">CSS</h1>
```

```
.shadow{  
  text-shadow: 2px 2px 5px gray;  
}
```

Output

The text **CSS** appears with a gray shadow.

6. Letter Spacing

Definition

The `letter-spacing` property increases or decreases the space between characters.

Example

```
<p class="letter">CSS Tutorial</p>
```

```
.letter{  
  letter-spacing:5px;  
}
```

Output

CSSTutorial

7. Word Spacing

Definition

The `word-spacing` property changes the space between words.

Example

```
<p class="word">  
Welcome to Full Stack Development  
</p>
```

```
.word{  
  word-spacing:15px;  
}
```

Output

Welcome to Full Stack Development

8. Line Height

Definition

The `line-height` property specifies the space between lines of text.

Example

```
<p class="line">  
HTML and CSS are the building blocks of web development.  
Learning CSS makes webpages attractive.  
</p>
```

```
.line{  
    line-height:40px;  
}
```

Output

The distance between each line increases.

9. Font Family

Definition

The `font-family` property specifies the font style of text.

Example

```
<p class="font">  
Welcome to CSS  
</p>
```

```
.font{  
    font-family:Arial;  
}
```

Output

The text is displayed using the **Arial** font.

10. Font Size

Definition

The `font-size` property specifies the size of the text.

Example

```
<p class="size">  
CSS Tutorial  
</p>
```

```
.size{  
    font-size:30px;  
}
```

Output

The text appears in **30px** size.

11. Font Weight

Definition

The `font-weight` property specifies the thickness of the text.

Values

- normal
- bold
- lighter
- bolder
- 100-900

Example

```
<p class="weight">  
Full Stack Development  
</p>
```

```
.weight{  
    font-weight:bold;  
}
```

Output

Full Stack Development

12. Google Fonts

Definition

Google Fonts is a free online library that provides hundreds of fonts for websites.

Step 1: Open Google Fonts

Visit:

<https://fonts.google.com>

Step 2: Choose a Font

Search for a font (Example: **Poppins**).

Click **Get Font**.

Step 3: Copy the Embed Code

```
<link rel="preconnect" href="https://fonts.googleapis.com">

<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>

<link href="https://fonts.googleapis.com/css2?
family=Poppins:wght@300;400;600&display=swap" rel="stylesheet">
```

Paste these lines inside the `<head>` section of your HTML document.

Step 4: Use the Font in CSS

```
body{
    font-family:'Poppins', sans-serif;
}
```

Complete Example

HTML

```
<!DOCTYPE html>
<html>

<head>

<title>Google Fonts</title>

<link rel="preconnect" href="https://fonts.googleapis.com">

<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>

<link href="https://fonts.googleapis.com/css2?
family=Poppins:wght@300;400;600&display=swap" rel="stylesheet">

<link rel="stylesheet" href="style.css">

</head>

<body>

<h1>Welcome to Full Stack Development</h1>

</body>

</html>
```

CSS

```
body{

font-family:'Poppins', sans-serif;

}
```

Output

The webpage is displayed using the **Poppins** font.

Summary

Property	Purpose
<code>color</code>	Changes text color
<code>text-align</code>	Aligns text
<code>text-decoration</code>	Adds or removes text decoration
<code>text-transform</code>	Changes letter case
<code>text-shadow</code>	Adds shadow to text
<code>letter-spacing</code>	Adjusts space between letters
<code>word-spacing</code>	Adjusts space between words
<code>line-height</code>	Controls spacing between lines
<code>font-family</code>	Specifies the font style
<code>font-size</code>	Sets the font size
<code>font-weight</code>	Sets the font thickness
Google Fonts	Imports custom fonts from Google Fonts
